

## Create a new GitHub repository.

- Clone the repository to your local machine using SSH (generate an SSH key if needed, add the public key to your GitHub account).
- Create a new branch named after your username (e.g., Tutedude).
- Add your Flask project files to this branch.
- Commit the changes and merge the branch into the main branch.

New Repository created .

Git hub ssh key added.

The screenshot shows the GitHub 'SSH keys' page. On the left is a sidebar with navigation links: Public profile, Account, Appearance, Accessibility, Notifications, Access, Billing and licensing, Emails, Password and authentication, Sessions, SSH and GPG keys (highlighted), Organizations, Enterprises, Moderation, Code, planning, and automation, Repositories, Codespaces, and Models. The main content area is titled 'SSH keys' and includes a 'New SSH key' button. Below this is a section for 'Authentication keys' with a list of keys. One key is shown: 'Devops' with a SHA256 fingerprint, added on Dec 9, 2025, and marked as 'Never used' and 'Read/write'. A 'Delete' button is next to it. Below the list is a link to a guide on connecting to GitHub using SSH keys. The next section is 'GPG keys' with a 'New GPG key' button and a message stating there are no GPG keys associated with the account. The final section is 'Vigilant mode' with a checkbox for 'Flag unsigned commits as unverified' and a link to learn about vigilant mode.

Public profile

## 2. Create a new branch named <your\_name>\_new (e.g., Tutedude\_new).

- Update the content of the JSON file used for the /api route in this branch.
- Merge the <your\_name>\_new branch into the main branch.
- If there are conflicts during the merge, resolve them by accepting the changes from the <your\_name>\_new branch.

- Add the resolved changes to the staging area, commit them, and push the updates to the remote repository.

There were no conflict in merge so only commit is there.

```
$ git add data.json
